Pregnant women and their babies are at increased risk of contracting the bacteria and viruses that cause foodborne illness. Foodborne illness during pregnancy can cause serious health problems for your baby, including prematurity and stillbirth. Some foodborne illnesses, such as listeriosis and toxoplasmosis, can infect your baby even if you do not have symptoms of foodborne illness. Make safe food handling a priority for you and your baby while pregnant.

What you can do to properly prepare food:

- **Wash your hands before and after preparing food.** Many diseases and conditions are spread by not washing hands with soap and clean, running water. Germs from unwashed hands can get into foods and drinks while people prepare or consume them. Germs can multiply in some types of foods or drinks, under certain conditions, and make people sick.

- **Do not eat raw or runny eggs or raw sprouts.** Raw or undercooked eggs and raw sprouts can contain *Salmonella*, a bacteria which can be passed to your baby during pregnancy. Cook egg dishes until they have an internal temperature of 160 degrees and cook eggs until the yoke and white are firm.

- **Avoid unpasteurized (raw) milk and cheese and other foods made from them.** Soft cheeses made from unpasteurized milk can contain *Listeria*, a harmful bacteria. Only buy soft cheese and milk with the word “pasteurized” on the label. Pasteurized means that the milk was heated to a high enough temperature for a long enough time to kill illness-causing bacteria.

- **Clean, separate, cook, and chill food.**
  USDA, FDA, CDC, and the Ad Council recommend that everyone take these steps for general safe food preparation:
  - **Clean:** Wash hands and surfaces often.
  - **Separate:** Don’t cross-contaminate.
  - **Cook:** Cook to safe temperatures.
  - **Chill:** Refrigerate promptly.

Learn how you can prevent risk of toxoplasmosis and other infections from food.
Whether you are planning to become pregnant or not, talk to your healthcare provider about reproductive and preconception health care. Talk to your healthcare provider about what you can do to prevent infections, including Zika virus and sexually transmitted diseases (referred to as STIs or STDs), before and during pregnancy, make sure that you are up-to-date with vaccinations (shots) before getting pregnant, and talk to your healthcare provider about vaccinations that you should receive during pregnancy.

**Consider discussing these topics with your healthcare provider to reduce your risk of getting an infection during pregnancy:**

**Throughout Your Pregnancy**

**Influenza (Flu) Shot**
Get a flu shot during any trimester of your pregnancy to protect from flu.

**Foodborne Illness**
See your healthcare provider immediately if you show any signs of food borne illness, such as fever, stomach pain, and vomiting. Your healthcare provider can prescribe the appropriate antibiotics, if needed.

**Travel**
Talk to your doctor before making any travel decisions that will take you far from home. Depending on your travel destination, you may need to receive certain vaccines and medicines before traveling.

**Trimester 1 (Weeks 1-12)**

**Sexually Transmitted Infections (STIs)**
Get tested for chlamydia, syphilis, hepatitis B, herpes simplex virus type II, and HIV at your first prenatal visit.

**Trimester 2 (Weeks 13-28)**

**Urinary Tract Infections (UTIs)**
Get tested for UTIs, which are infections of the kidney, bladder, or urinary tract. Pregnant women should have their urine tested as a part of routine pregnancy care.

**Group B streptococcus (GBS)**
GBS is a bacteria that can cause serious health problems in newborn babies. If you think you might have a C-section or go into labor early, talk with your healthcare provider about making a GBS plan.

**Trimester 3 (Weeks 29-40)**

**Group B streptococcus (GBS)**
GBS is a bacteria that can cause serious health problems in newborn babies. Get tested for group B strep bacteria when you are 35 to 37 weeks pregnant.

**Pertussis (Whooping Cough) Shot**
Pertussis, also known as *whooping cough*, is a highly contagious disease that causes violent coughing. Get the pertussis shot (Tdap) when you are 27-36 weeks pregnant.

Pregnant women have to be careful about how they handle and care for animals. Pets can carry bacteria, viruses, and parasites that can cause several infections that can harm you and your baby, including toxoplasmosis, lymphocytic choriomeningitis virus (LCMV), and salmonellosis.

Pregnant women should also take steps to reduce their risk of being bitten by a mosquito. Mosquitoes can carry several infections, including West Nile virus, Dengue virus, malaria, and Zika virus. Zika infection during pregnancy can cause a serious birth defect called microcephaly a sign of incomplete brain development.

What you can do to protect yourself from animals and insects:

- Stay away from wild or pet rodents, live poultry, lizards and turtles, and do not clean cat litter boxes while pregnant. Have a pest control professional get rid of pests in or around your home. If you have a pet rodent, like a hamster or guinea pig, have someone else care for it until after your baby arrives. Some rodents might carry a harmful virus. Wash your hands well with soap and water after contact with your pets, and their tanks or poop.

  Dirty cat litter might contain a harmful parasite called Toxoplasma gondii, which causes toxoplasmosis. Have your partner, a friend, or family member change used cat litter for you. If you must change the litter yourself, be sure to wear gloves and wash your hands afterwards.

- When mosquitoes are active,
  - Wear long-sleeved shirts and long pants when outside. Mosquitoes can carry several infections, including West Nile virus, Dengue virus, malaria, and Zika virus. Ticks can also carry many infections, such as Lyme disease. These infections can be dangerous to your unborn baby. Lyme disease that goes untreated can cause brain, nerve, spinal cord, and heart problems while Zika infection during pregnancy can cause a serious birth defect called microcephaly.

  Mosquitoes are most active at dusk and dawn while ticks are active at all times of the day, typically in warmer months. Minimizing areas of exposed skin by wearing long-sleeved shirts, long pants, boots, and hats can help prevent bites.

  - Use Environmental Protection Agency (EPA) registered insect repellents with one of the following active ingredients: DEET, picaridin, IR3535, or oil of lemon eucalyptus (para-menthane-3,8-diol). Insect repellants prevent bites by making people less attractive to mosquitoes and ticks. When used as directed, EPA-registered insect repellents are proven safe and effective, even for pregnant and breastfeeding women.

Hygiene refers to the activities that help prevent the spread of infections. Personal hygiene can include hand washing, bathing, and brushing your teeth. Maintaining good hygiene is one of the simplest steps that women can take to prevent infections. Many diseases and conditions are spread by not maintaining good hygiene, including salmonellosis, norovirus, adenovirus, and hand, foot, and mouth disease.

**What you can do to maintain good hygiene:**

- Wash your hands often with soap and water, especially
  - Before preparing foods or eating foods,
  - After handling raw meat, raw eggs, or unwashed vegetables,
  - After being around or touching pets or other animals,
  - After changing diapers or wiping runny noses.

Regular handwashing is one of the best ways to remove germs and prevent the spread of germs to others. Learn more about how and when to wash your hands:

- Do not put a young child’s food, utensils, drinking cups, or pacifiers in your mouth. Children’s saliva or urine may contain a virus called cytomegalovirus (CMV), which women can pass to their baby during pregnancy. Always remember to wash your hands after coming in contact with any bodily fluids, such as saliva or urine.
